Hasil Query SQL:

The screenshot shows the DBeaver SQL Editor interface. The main window displays a SQL script for creating and modifying a table named `villa_data`. The script includes the following commands:

```
create database ubuvilla;  
  
select *  
from villa_data;  
  
-- sort price by the most expensive  
select *  
from villa_data  
order by "Price_1" desc;  
  
alter table villa_data  
drop column "Price_1";  
  
-- rework bedroom and capacity  
alter table villa_data add column bedroom_num integer;  
  
select  
  substring("Bedrooms" from '\d+') as bedroom_num  
from villa_data;  
  
update villa_data  
set bedroom_num = cast(substring("Bedrooms" from '\d+') as integer);  
  
alter table villa_data add column capacity_num integer;  
  
select  
  substring("Capacity" from '\d+') as capacity_num  
from villa_data;
```

Below the script, a table view titled `villa_data 1` is shown. It displays the data loaded from the `villa_data` table. The table has the following columns: `id`, `title`, `address`, `Bedrooms`, `Bathrooms`, `Parking`, `Capacity`, and `Price_1`. The data is sorted by `Price_1` in descending order.
